Actively
monitoring
**the safety of
vaccines.**
Smart **Vax**

In partnership with
AusVaxSafety

SmartVax[®] uses automated SMS technology to actively monitor the safety of all vaccines given in general practice and vaccination clinics in Australia.

SmartVax[®] is used in general practices and immunisation clinics across Australia.

How Does It Work?

A text message will be sent 3 days after your vaccination, enquiring if you experienced a reaction. Most reactions are minor, such as low-grade fever, pain or redness at the injection site. If you experienced a reaction, respond with a simple Y for Yes or N for No. Yes responses are followed by a second message enquiring if medical attention was needed.

If you report a reaction, you will also receive an SMS containing a link to a brief, 2 minute survey that you can complete from your smart phone. The survey will gather further information regarding the nature, severity and duration of the reaction.

Remember, immunisations save millions of lives each year.

With SmartVax[®], you can play a role in monitoring the safety of vaccines in Australia.

What is the data used for?

Data derived from this system is de-identified and may be used by immunisation providers, AusVaxSafety & Departments of Health to:

- **Conduct** rapid vaccine safety surveillance in children and adults
- **Monitor & Research** the safety of vaccines and changes to the immunisation schedule
- **Refine** and improve existing vaccine programs in Australia

AusVaxSafety

surveillance initiative led by the National Centre for Immunisation Research and Surveillance

AusVaxSafety is a national collaborative vaccine safety

(NCIRS) and funded by the Australian Government Department of Health.

Using SmartVax[®] and other data, AusVaxSafety actively monitors the safety of vaccines used in Australia.
